Fedor Lisin

Data Scientist

Moscow, Russia RU

theo.lisin@gmail.com +7 (965) 004-85-95
TheoLisin @TedFox theo-lisin

It took me around two years to realise that I like programming in general and data science in particular. Since taking the Yandex classes, well-written, readable code has become my intention. My current focus is creating products that benefit or facilitate the lives of people, not just reviewers.

SKILLS

ML and Data Science
Intermediate

sklearn | PyTorch | statistics | linear algebra

Python Development
Advanced

FastAPI | Pydantic | ORM | SQLAlchemy | ML frameworks

CI/CD
Beginner

Docker | Docker Compose | Github Actions | Gitlab Pipelines

C/C++
Beginner

Common

VSC | Gitlab | Github | Reviewing | Linux

WORK EXPERIENCE (3)

Research Engineer at Huawei — **2024 - Current**

Research on ways to improve Wi-Fi quality of service (QoS) and solve optical tasks.

- Developed model for traffic delay prediction and improved simulation of the GPON system using NS3 library (Classinc ML, C++)
- Set up an environment to simplify and accelerate the work of the team: S3 storage for raw data, MLFlow for experiment logging (Docker)
- Researched symbolic regression methods for tasks involving optical physics models (RL, FunSearch, MCTS)

Python Developer at Supervisely OÜ — **2023 - 2023**

Create a new app on the Supervisely platform for model serving and training

- Developed new SOTA model training and serving applications for the Supervisely ecosystem (PIPs, YOLO, MMDetection, MixFormer etc.)
- Enhanced capabilities of the SDK: support for point and object tracking with NN models and linear interpolation
- Found and fixed several critical bugs in the cache functionality, which was causing applications to crash (Pytest, Asyncio)

Junior Data Scientist at OCRV, Russian Railways affiliated company — **2021 - 2022**

Developed different models from scratch for tabular data and time series, upgraded the current data infrastructure, supervised the students' self-study pet projects.

- Train delay investigation system: improving data infrastructure with PySpark, time to create the final dataset was at least cut in half. (Catboost, PySpark, ClickHouse)
- EEG motor imaginary classification: examining the primary methods for getting, classifying, and filtering EEG data, as well as developing experimental data collection methods. (ICA, SSP, WPD)
- Recommendation system for ticket sales: assisted interns with GIT and Django, helping to implement baseline solutions. (Git, Conda, Django)

PROJECTS (2)

Voice emotion recognition using Wav2Vec — **2021 - 2021**

https://github.com/TheoLisin/Emotion_Recognition_with_Wav2Vec

Wav2Vec | transformers | telegram-api

Speech emotion recognition model based on Wav2Vec with telegam-bot user interface.

- Trained 8-class classifier on RAVDESS dataset using Wav2Vec pre-trained model.
- Developed a Telegram bot to gather more data and test the model on Russian speech.

Monotone Hurwitz numbers in genus zero — **2019 - 2020**

mathematical physics | graph theory

University-authored bachelor's thesis

EDUCATION (2)

Bachelor Theoretical Physics at St. Petersburg Academic University of RAS — **2016 - 2020**

Data Science, MLOps at MADE Data Academy — **2022 - 2023**

CERTIFICATES

Machine learning | course authored by Stanford University
Coursera, Stanford University — **2020-07-25**

https://coursera.org/share/fcf17fea90f4868b828c71c2cad3ff7c

Machine Learning Engineer
MADE Data Academy — **2023-07**

https://data.vk.company/curriculum/certificates/download/12961/f84e3606-6030-4ce7-895f-4b2defe55aff/
